

I support this bill...the confusion of having several types of amateur radio transmissions below 1.843KHZ in the 160 Meter segment of the amateur bands would be a disservice to all amateurs..

The other amateur Radio frequencies all have segmentated sections, this bill would insure the same treatment for this frequency which is being used more and more as amateurs move up to this frequency as the sun spots begin to change, during the 11 year cycle...

The frequency above 1.843 is more than ample space for those amateurs that wish to use other mode, other than Morse Code, such as SSB...

Please consider making the Morse Code section of 160 Meters an all narrow mode of transmission, it is for the best of the amateur field and also more importantly, for the future, which will bring about many changes in transmissions..As an avid amateur operator, I don't appreciate trying to copy a station on code, while someone is transmitting SSB right next to me, makes it very difficult to say the least...
